Problem $\mathcal{X}$: Is the gap between passengers travelling by themselves and passengers travelling as a pair larger than the gap between British and American passengers? If not, which gap is larger and by how many percentage points?

① The question asks us to compare two percentage gaps: the party-type gap and the nationality gap.

② From the PARTY TYPE panel, 47% of passengers are travelling by themselves and 27% are travelling as a pair.

④ From the NATIONALITY panel, 42% of passengers are British and 13% are American.

③ So the party-type gap is $47 - 27 = 20$ percentage points.

⑤ So the nationality gap is $42 - 13 = 29$ percentage points, which is larger than 20.

⑥ Therefore, the gap between British and American passengers is larger, by $29 - 20 = 9$ percentage points.
